

ABSTRACT OF THE DISCLOSURE

While viewing a program, a viewer can check the other program at arbitrary timing. While a program on a channel received by a first tuner 1 is being output, when a commercial starts or a start signal is input from an operation portion 6, an output of the program is changed to that of a program received by a second tuner. The viewer can select either outputting the program on the channel designated by the second tuner 2 or sequentially changing channels received by the second tuner 2 and sequentially outputting different programs according to a viewer's desire. When the commercial is over or an end signal is input from the operation portion 6, the output is changed to that of the program received by the first tuner 1 and the original program is output.
